

Impact and Follow-through

1 issues

Low-to-High Scooping Motion

Keyframe 1s · Impact and Follow-through

High

The racket head drops significantly below the ball, and the forearm pulls upward abruptly at impact rather than driving through the ball. This creates a steep vertical trajectory instead of a 'hitting through 3 balls' linear path.

Why it matters

Resulting in shots that lack depth and pace, often landing short or becoming too 'loopy' and easy for the opponent to attack.

Improvement tips

- Focus on hitting 'through' the ball, imagining you are striking through a line of three balls.
- Keep the racket face more vertical and stabilized at the moment of contact.
- Extend the hitting arm further forward towards the target before starting the windshield wiper finish.

Drills

Hand-fed 'Drive-through' drill: Focus on hitting the ball flat into the back fence without much spin.

Racket cover drill: Practice swinging with a racket cover to feel the air resistance and encourage a fuller forward drive.

Forward Swing

1 issues

Incomplete Racket Lag and Snap

Keyframe 0.5s · Forward Swing

Medium

The transition from the backswing to the forward swing lacks the 'lag' characteristic of the modern forehand. The wrist is not fully laid back, leading to a push-like motion rather than a whip-like acceleration.

Why it matters

Reduces potential for both topspin and power, making the stroke less efficient.

Improvement tips

- Relax the grip (aim for a 3-4 out of 10 tension).
- Allow the racket butt-cap to lead the forward motion towards the ball.

Drills

Drop-hit drills focusing specifically on letting the racket head hang back as the hips start to rotate forward.
